

Lab 2 — AI Use

LLM/Agent Used: ChatGPT

#	Prompt (Summarised)	What I Did with the Result
1	Reviewed my database structure, identified fields that should be unique, converted the design into Markdown tables, and suggested improvements.	Reviewed the suggestions and updated <code>design/database.md</code> .
2	Asked ChatGPT to organize and improve my project documentation.	Reorganized the specification, API, database, and test documentation for consistency.
3	Asked ChatGPT to split the project files into a clearer structure: <code>route</code> , <code>controller</code> , and <code>service</code> for the server side, and <code>api</code> , <code>lib</code> , and <code>page</code> for the client side.	Reviewed the proposed structure and reorganized the files to make the project easier to maintain.

Also, use ChatGPT For smaller syntax or ui change

LLM/Agent Used: Gemini

#	Prompt (Summarised)	What I Did with the Result
1	Updated the database design with ticket priorities, statuses, and their relationships.	Applied the changes to the schema, seed data, and documentation.
2	Added <code>PublicComments</code> , <code>ServiceActions</code> , and <code>EventLog</code> with their required relationships and operations.	Implemented the models and updated the related documentation.
3	Asked Gemini to rewrite and implement tests based on my specification and test results.	Reviewed the tests and used the results to fix the implementation.

LLM/Agent Used: VS Code Copilot Extension — ChatGPT 5.6 Luna

#	Prompt (Summarised)	What I Did with the Result
1	Asked it to create the Prisma schema and seed data based on the database specification.	Reviewed and adapted the generated files to my project.
2	Pasted the specification and asked it to implement only the My Tickets and Requester Selection pages.	Reviewed the implementation and adjusted it to match the specification.
3	Asked it to organize the code into <code>page</code> , <code>lib</code> , <code>api</code> , <code>route</code> , and <code>service</code> folders.	Reviewed and adjusted the generated structure.
4	Asked it to re-check the implementation against <code>specification.md</code> . It found eight major issues.	Fixed the issues and updated <code>specification.md</code> and <code>api-spec.md</code> .
5	Pasted the complete specification and instructed it to implement only specific pages.	Checked that the changes stayed within the requested scope.
6	Pasted <code>test.md</code> and asked it to implement the tests file by file. After each implementation, and run test only after the code is complete.	Made small fixes based on failed tests and repeated the process until all tests passed.

Reflection

This lab mainly revolved around **pasting an already-prepared specification into AI and using it to guide the implementation**. I found that AI was useful for quickly generating code, tests, database changes, and documentation.

One thing I learned is that limiting Copilot's commands is sometimes necessary. If I give it too much freedom, it can sometimes go out of context or make changes that are not needed. I also found that I should not allow it to run `npm run build` unnecessarily during development, since it generate files. For the next lab, I might remove or restrict this command during the development phase.

Overall, AI helped speed up development and identify errors, while testing reviewing and made small adjustment.
