

Lab 2 — AI Use

LLM/Agent Used: ChatGPT 5.6 Luna/Tera (Codex/Copilot)

#	Prompt (Summarised)	What I Did with the Result
1	Read the project specification and narrowed it down to 5 key issues instead of 10.	Reviewed the issue list, selected the most relevant items, and used them to guide implementation planning.
2	Pasted the issues and the specification.md for all the 3 issues left.	Generate the core structure of api and client side. Also, implement the test of related to the issue in another prompt.
3	Requested small UI adjustments, including moving the filter bar and adding error text styling.	Applied the visual refinements and improved the error message presentation in the interface.
4	Pasted an older page and asked the agent to make the UI consistent with the newer design.	Compared the old and new layouts, adjusted the styling, and aligned the page with the existing UI system.
5	Included the entire specification content in the prompt so the agent could work from the full project requirements.	Reviewed the complete specification, used it as the source of truth, and aligned the implementation with the documented requirements.

LLM/Agent Used: Gemini 3.8 (Antigravity)

#	Prompt (Summarised)	What I Did with the Result
1	Implemented Issue 11: Lab 3 data model, database migration from Lab 2, idempotent seed data, and unit/migration tests.	Reviewed implementation plan, validated migration and seed idempotence, and confirmed all automated tests passed.
2	Implement and fixed the end-to-end test failures and resolved the errors.	Create the E2E test and Reviewed the failing E2E flow, corrected the underlying

#	Prompt (Summarised)	What I Did with the Result
		issues, and verified the tests passed.

Reflection

This lab mainly involved **pasting an already-prepared specification into AI and using it to guide the implementation**. There were fewer personal adjustments compared to Lab 2, although sometimes the AI implemented only the client, server, or test side, so it was necessary to re-prompt it and specify the exact part to implement, such as writing the test in a separate prompt. There were still some errors when running the tests, and sometimes it was necessary to step back and re-evaluate the tests.
